

CHAPTER 6: SOUTH CAROLINA'S PRIORITY SPECIES (SPECIES OF GREATEST CONSERVATION NEED)

The Southeast North American Coastal Plain is considered a global biodiversity hotspot, and South Carolina contributes to this high species diversity through its topography, latitude, and vast river systems (Jenkins et al. 2015, Noss 2016). Habitats in this state range from the mountains to the ocean and include many different taxonomic animal groups. Although all native biota are important to maintain fully functioning ecosystems critical to all life, not all are experiencing declines, and some are actually increasing their populations. As per the federal requirements for State Wildlife Action Plans (SWAPs), prioritization is required. Reasons to prioritize include urgency of conservation efforts needed, funding availability, capacity to implement conservation actions, and feasibility of those actions, among other reasons.

The South Carolina Department of Natural Resources (SCDNR) wanted to address as many native taxa groups as possible for inclusion in the list of priority species—Species of Greatest Conservation Need or SGCN—for the South Carolina SWAP. Therefore, 16 taxonomic groups are included in the Strategy: mammals, birds, reptiles, amphibians, freshwater fish, diadromous fish, marine fish, marine invertebrates, crayfish, freshwater shrimp, freshwater mussels, freshwater snails, freshwater sponges, leeches, insects, and plants. Though not a requirement but encouraged, the inclusion of plants is a proactive response to the need for landscape-level management, wherein plants are an integral component. Plants are not eligible for funding under the State and Tribal Wildlife Grants (SWG) Program or the related Competitive SWG but are of concern nonetheless as they are the basis of the habitats that support vertebrate and invertebrate (“animal”) species that are eligible for funding.

Species Selection Process (Methodology)

After the 16 taxonomic groups were identified, a taxa leader was appointed that managed the process for identifying priority species for conservation within that group. This leader formed a committee or team of experts for their specific taxa. First, the committee reviewed a list of all known species within that group that are found in South Carolina to make sure their subnational (state) ranks (S-ranks) were updated and correct. SCDNR's GIS team built a decision support tool (“SWAP Tool”) which roughly follows the NatureServe methodology to calculate provisional S-ranks automatically using existing data for a given species, either within the [South Carolina Natural Heritage Program](#)'s database or the [Global Biodiversity Information Facility \(GBIF\)](#) if applicable. The NatureServe Rank Calculator categorizes species status data based on range extent, area of occupancy, abundance/condition, environmental specificity, threat impact, intrinsic vulnerability, short term trends, and long-term trends. A detailed summary of the official ranking methodology can be found in *NatureServe Conservation Status Assessments: Methodology for Assigning Ranks* (Faber-Langendoen et al. 2012) and is a *Best Practices for State Wildlife Action Plans* (AFWA 2012) recommended tool for SGCN evaluation.

[NatureServe definitions of S-ranks](#) are as follows:

- S1 (critically imperiled)
- S2 (imperiled)

- S3 (vulnerable)
- S4 (apparently secure)
- S5 (secure)
- Ranks with 'N' (Nonbreeding), 'M' (Migratory), and 'B' (Breeding) refer to conservation status for a species specifically during that portion of its life history.

These S-ranks then inform the global ranks (G-ranks) created by NatureServe.

Specifically, the SWAP Tool used the 'rarity' factors including range extent, area of occupancy, and number of occurrences. Threats and trends factors are more subjective and relied on expert knowledge of the species. Therefore, SCDNR taxa team leads subsequently reviewed these provisional ranks and changed the threats and trends factors accordingly which shifted the suggested rank up or down. While the methodology only required the rarity factors to produce a rank suggestion, the threats and trends played an important role in shifting the ranks up or down significantly if a species had heavy pressures like habitat loss, disease, significant downward (or upward trends), etc.

Some taxa groups, such as those that included invertebrates, were depauperate in terms of data available, resulting in barriers to conservation management. Examples may include the following knowledge gaps which resulted in some species not being ranked ['not ranked' (SNR)] or 'unrankable' (SU) designations at this time.

Knowledge Gaps

- taxonomic uncertainty
- unknown population status and trends
 - fecundity
 - survival rates (including viability of seed banks over time)
 - recruitment
 - genetic structure
 - sex ratio
 - minimum viable population
- unknown life history needs
 - life cycle
 - food requirements
 - habitat associations by season
- unknown threats
- conservation action outcomes uncertainty

In other cases where some level of knowledge is known about the state of a species' threats, trends, or rarity but there is still uncertainty associated, range ranks and inexact ranks are implemented, which are intended to account for this uncertainty. Examples of inexact ranks include: S3?, S2S3, etc. Additional letters may appear in a species' ranking such as in the status of infraspecific taxa (subspecies or varieties) which are indicated by a "T-rank" (see [NatureServe's Conservation Status Categories](#) for further explanations.

The criteria experts considered when deriving their final SGCN lists are shown in Box 6-1, many of which are part of the NatureServe Rank Calculator. Please note that for freshwater fishes, the species selection process was informed by a data-based index quantifying multiple ecological attributes influencing conservation need (Appendix 5).

BOX 6-1: CONSIDERATIONS FOR SGCN INCLUSION

- State and federal protection status: endangered, threatened, at-risk, rare, or special concern; other listings (IUCN, etc.)
- Previous SWAP inclusion as an SGCN
- South Carolina Natural Heritage Program subnational rank as reported to NatureServe
- Degree of exploitation/harvest: high, medium or low
- Feasibility measure: the likelihood that conservation activities in South Carolina can make a difference for this species
- Regional SGCN listing
- Knowledge of the species' population status
- Knowledge of species' distribution in the state
- Knowledge of limiting factors affecting the species
- Population status (trend): population decreasing, stable or increasing
- Keystone species, sentinel species, or major prey base

Some SGCN in South Carolina's SWAP may have funding available elsewhere to address management needs (i.e. Wildlife and Sport Fish Restoration funds), but this did not automatically preclude them from being listed as an SGCN. Instead, funding options are considered when State Wildlife Grant requests are put forth, with preference given to those species for which no other funding sources exist. See Chapter 8 for more details. It should also be noted that some of the species that are included in the current SGCN list are considered game species that are harvested through regulated hunting or fishing. Regulated harvest of game and fish species is not considered a threat to populations. Nonetheless, other threats such as habitat loss and degradation are of concern for certain game species. These populations and their habitats, as well as regulated harvest, are and will be carefully monitored, and efforts should continue to be made to enhance, restore, and acquire additional habitat for SGCN species.

Once all S-ranks were reviewed and confirmed as finalized by staff, the SWAP Tool also automatically calculated a provisional SWAP priority value of Highest, High, Moderate, or Data Deficient based on a rubric developed by the Southeast Association of Fish and Wildlife Agencies, Wildlife Diversity Committee (2022) in the *SGCN Recommendation Report* (funded through a Competitive State Wildlife Grant). This rubric (Figure 6-1) took into consideration not only S-rank and global rank (G-rank) but also the following:

- [Endangered Species Act \(ESA\)](#) status
 - Endangered (E)
 - Threatened (T)
 - Candidate (C)
- [State of South Carolina](#) (pg. 54-56) listing status
 - Endangered
 - Threatened

- [International Union for Conservation of Nature \(IUCN\) Red List](#) status
 - Data Deficient (DD)
 - Least Concern (LC)
 - Near Threatened (NT)
 - Vulnerable (VU)
 - Endangered (EN)
 - Critically Endangered (CR)
 - Extinct in the Wild (EW)
 - Extinct (EX)
- [Partners In Flight \(PIF\) Watchlist](#) status
 - Red List
 - Yellow Lists – restricted range (R) and declining populations (D)
 - Common Bird in Steep Decline (CBSD) but criteria not met for listing
- Southeast Regional Species of Greatest Conservation Concern (RSGCN) status for both [animals](#) (2019) and [plants](#) (2023)
 - Very High
 - High
 - Moderate

Data Deficient species were self-evident, having a lack of data on which to base a solid definition of status yet still of conservation concern based on criteria previously mentioned in Box 6-1. The taxa teams made sure that the automatic sorting process resulted in a prioritized list of species for the SWAP and compared this to the 2015 SGCN list to legitimize changes.

Insects are one of the taxa groups containing many data deficient species.

FIGURE 6-1: Rubric used to determine South Carolina's SGCN priority status.

As with the S-ranks, all SWAP priorities calculated by the SWAP Tool were meant to be a suggestion that the taxa team lead could agree with or make manual changes to/override if preferred, which some did. Therefore, the SGCN decision making process can be defined by the flowchart depicted in Figure 6-2.

FIGURE 6-2: Flowchart of the SGCN selection process.

Species Listing Format

South Carolina's SGCN list is included in this chapter (Table 6-2). Once the lists were completed by the taxa teams, species or guild (group) accounts were prepared for each animal on South Carolina's SGCN list with the exception of plants and insects. For those SGCN that received a written account, each followed a standardized format to make sure Required Elements 1-6 were included. Authors described the species, their status, population size and distribution, habitat requirements, challenges faced, conservation accomplishments thus far, conservation recommendations for future action, and how to measure success. All accounts are consolidated under separate cover in the **Supplemental Volume: Priority Species and Habitat Accounts** which can be found on the SCDNR SWAP website. The last column in Table 6-2 below references how each individual SGCN was incorporated into the Supplemental Volume—either individually or as part of a guild. However, the last column in the Plants taxa section references an Excel spreadsheet in the Supplemental Volume. It details each species' priority habitat associations as determined by the taxa committee and presented in a format reminiscent of those of Hamel (1992), Trani et al. (2007), and Wilson (1995) in which X's appear in rows and columns. The Insects and Allies taxa's last column contains generalized location and habitat associations if known. These alternative SGCN representations serve as the plant and insect alternative to the species/guild narrative approach as many of these species are so data deficient that there is not enough information to discuss. Although habitat needs and life history traits are

not expounded upon for insects and plants, they are still viable portions of this SWAP as threats and action items are addressed for them in Chapter 4.

Total Number of Animals Species		889
Grand Total of All Species (including plants)		1,773

The total number of species included in South Carolina's 2025 SWAP is 889 members of the animal kingdom and 874 plants for a grand total of 1,773. The species representation is almost exactly half animals and half plants. Table 6-1 identifies the number of species included in each taxa group while Figure 6-3 represents this data graphically. Priority rankings for the species resulted in 11% of species in the Highest bin (mostly herpetofauna), 55% High (mostly plants), 9% Moderate (mostly marine invertebrates), and 25% Data Deficient (mostly insects and allies). Interestingly, of the total plant SGCN, the vast majority were in the High or Highest priority bins. Figure 6-4 demonstrates the frequency of bin rankings graphically.

FIGURE 6-4: The frequency of bin rankings of SC's SGCN.

Non-prioritized Species and Urbanized Environments

South Carolina is home to many other species of plants and animals that do not appear in this SWAP. However, the premise of the SWAP is to not only prioritize and assist SGCN but also keep common species common. Although common species such as White-tailed Deer, Eastern Wild Turkey, Mourning Dove, Bobcat, Black Bear, Raccoon, Virginia Opossum, Grey Fox, and Red Fox, among others, do not feature in the SWAP, they too will benefit from habitat protection, restoration, and management regimes implemented for SGCN.

Additionally, even though urban environments do not feature in this SWAP, they too can provide habitat for both common species and SGCN. Despite their comparatively low habitat value relative to wilderness areas, well-managed urban settings can provide important ecological functions and

benefits. Urban trees, shrubs, and grasses provide habitat for many of the more common species of birds, mammals, reptiles, and amphibians. This vegetation cools air temperatures, absorbs noise, filters pollutants from runoff while also controlling volume and velocity.

Treefrogs, like this Squirrel Treefrog, are a common occurrence on structures in the suburban environment. Photo by Anna Smith, SCDNR

Some common species of wildlife even do quite well in urban landscapes, having adapted to the opportunities human modifications provide. These include bridges and culverts utilized by bats and nesting swallows and bird boxes utilized by cavity-nesting species of squirrels and birds. The Purple Martin, a SGCN in the South Carolina SWAP, is now almost completely dependent on humans for the gourds erected for nesting. Likewise, the Chimney Swift, another SGCN, has declined due, in part, from the loss of traditional chimneys as a nesting substrate. In all, over 100 native bird species utilize these areas for breeding or stop-over habitat during migration (NBCI 2013). Eastern Glass Lizards, relatives of the two priority glass lizards in the SWAP—Island and Mimic—also can be quite common in urban and suburban sites. Many homeowners are accustomed to the sight and sound of treefrogs in their yards or clinging to windows and exterior walls.

Barn Swallows (left) often utilize human structures for nesting such as culverts, bridges, or this porch light. A shoe left too long outside may become a home for a Carolina Wren (right)! Photos by Anna Smith, SCDNR.

Residential neighborhoods can still provide habitat for wildlife when homeowners landscape with native plants, provide nesting sites, and provide alternative food and water sources. High-rise office buildings can provide nesting ledges for Peregrine Falcons and Least Terns while the buildings themselves can be built to [LEED certification standards](#) (such as using bird-safe exterior glass) to avoid some of the detrimental impacts of the buildings' footprints on the landscape. Nighttime lighting adjustments and encouraging pet owners to keep their cats indoors also help protect native wildlife in the urban environment. In addition, conservation-minded

zoning recommendations can be made to maintain travel corridors and a mosaic of appropriate habitat interspersed with urban or suburban areas.

South Carolina's List of Species of Greatest Conservation Need (SGCN)

TABLE 6-2: South Carolina's 2025 list of Species of Greatest Conservation Need (SGCN). The taxa groups are arranged as follows and in alphabetical order by scientific name with each troupings: ANIMALS – Mammals, Reptiles & Amphibians, Birds, Leeches, Diadromous Fishes, Freshwater Fishes, Freshwater Shrimps, Crayfishes, Freshwater Mussels, Freshwater Snails, Freshwater Sponges, Marine Invertebrates, Marine Fishes; Plants; and Insects & Allies (arranged by major groups). Blanks mean N/A. An icon  appears next to those species addressed in Chapter 7 as culturally significant. G- and S-ranks are updated periodically. Therefore, the information presented in this table displays the known rank at the time of publication. Those species with a protection status mean there are laws protecting them in some capacity at either a state or federal level or both. MBTA = Migratory Bird Treaty Act. Plants have a related Excel table in the Supplemental Volume instead of species/guild accounts. Insects and Allies have generalized location and habitat information in the last column and no further appearance in the Supplemental Volume.

<i>Oecetis daytona</i>	Daytona Long-horned Caddisfly	G3	SNR		Data Deficient		
<i>Oecetis morsei</i>	Morse's Long-horned Caddisfly	G3	SNR		Data Deficient		
<i>Oecetis parva</i>	Little Oecetis Longhorn Caddisfly	G2	SNR		Data Deficient		AQUATIC STAGE: Piedmont Ecobasin-Santee Drainage
<i>Oecetis porteri</i>	Porter's Longhorned Caddisfly	G3G4	SNR		Data Deficient		
<i>Oropsyche howellae</i>	Howell's Netspinning Caddisfly	G1	SNR		Data Deficient		
<i>Orthotrichia dentata</i>	Dentate Orthotrichian Microcaddisfly	G2G3	SNR		Data Deficient		
<i>Oxyethira dunbartonensis</i>	Dunbarton Oxyethiran Microcaddisfly	G2G3	SNR		Data Deficient		
<i>Oxyethira elerobi</i>	Elerob's Oxyethiran Microcaddisfly	G3G4	SNR		Data Deficient		
<i>Oxyethira roberti</i>	Robert's Oxyethiran Microcaddisfly	G3G4	SNR		Data Deficient		

<i>Oxyethira savanniensis</i>	Savannah Oxyethiran Microcaddisfly	G3	SNR		Data Deficient		
<i>Oxyethira sininsigne</i>	Indistinct Oxyethiran Microcaddisfly	G3G4	SNR		Data Deficient		
<i>Phylocentropus auriceps</i>	Gold-headed Pitot-tube Caddisfly	G3G4	SNR		Data Deficient		
<i>Polycentropus carlsoni</i>	Carlson's Trumpet-net Caddisfly	G2G3	S1S3		Data Deficient		
<i>Protoptila morettii</i>	Moretti's Saddle-case Caddisfly	G1G2	SNR		Data Deficient		
<i>Pseudogoera singularis</i>	Singular Mortarjoin Caddisfly	G2G3	SNR		Data Deficient		
<i>Psilotreta amera</i>	Long-spined Mortarjoint Caddisfly	G3G4	SNR		Data Deficient		
<i>Psilotreta rossi</i>	Ross' Mortarjoint Caddisfly	G3	SNR		Data Deficient		
<i>Pycnopsyche virginica</i>	Virginia Northern Caddisfly	G3G4	SNR		Data Deficient		
<i>Rhyacophila accola</i>	Neighbor Free-living Caddisfly	G1G2	SNR		Data Deficient		
<i>Rhyacophila amicus</i>	Friendly Free-living Caddisfly	G3G4	SNR		Data Deficient		
<i>Rhyacophila appalachia</i>	Appalachian Free-living Caddisfly	G3	SNR		Data Deficient		AQUATIC STAGE: Blue Ridge Ecobasin- Savannah Drainage
<i>Rhyacophila montana</i>	Mountain Free-living Caddisfly	G2G3	SNR		Data Deficient		
<i>Rhyacophila mycta</i>	Nosey Free-living Caddisfly	G3	SNR		Data Deficient		
<i>Rhyacophila teddyi</i>	Teddy's Free-living Caddisfly	G2	SNR		Data Deficient		
<i>Setodes arenatus</i>	Sand-loving Long-horned Caddisfly	G2G3	SNR		Data Deficient		
<i>Theliopsyche corona</i>	Crowned Bizarre Caddisfly	G2G3	SNR		Data Deficient		
<i>Theliopsyche epilonis</i>	Longer Bizarre Caddisfly	G2	SNR		Data Deficient		
<i>Trienodes bicornus</i>	Bifurcate Long-horned Caddisfly	G2G3	SNR		Data Deficient		
<i>Trienodes dendyi</i>	Dendy's Long-horned Caddisfly	G2G3	SNR		Data Deficient		
<i>Trienodes helo</i>	Marsh Trienode Long-horned Caddisfly	G3	SNR		Data Deficient		
<i>Trienodes morsei</i>	Morse's Long-horned Caddisfly	G1G2	SNR		Data Deficient		
<i>Trienodes smithi</i>	Smith's Long-horned Caddisfly	G3G4	SNR		Data Deficient		

<i>Trienodes taenia</i>	Ribboned Long-horned Caddisfly	G3G4	SNR		Data Deficient		
<i>Wormaldia mohri</i>	Mohr's Finger-net Caddisfly	G2G3	SNR		Data Deficient		
<i>Wormaldia oconee</i>	Oconee Finger-net Caddisfly	G1G2	SNR		Data Deficient		
<i>Wormaldia thyria</i>	Porthole Finger-net Caddisfly	G3	SNR		Data Deficient
